Assignment for the Developer

Task

Please, find DB schema and MySQL dump file in the "database" folder. Your task is to create PHP command line script that will fill DB tables with the data from XML RSS feed (e.g. http://www.feedforall.com/sample.xml). Script should be able to assign a category. URL and category name
must be accepted as a command line (Shell) parameters.

In addition, please implement a small website that displays a list of feed summaries for the specific category. Category name should be passed using the URL parameter.

The list must include:

● Feed title
● URL address
● Update date and time
● Articles count
● Most recent article's title and URL link

Requirements

● Application must work with PHP >=5.4, MySQL 5.6, Apache 2.4 or NGINX 1.4.4.
● Code must be written using CakePHP 2.9.x
(https://github.com/cakephp/cakephp/releases/tag/2.9.9) framework and OOP techniques.
● Provide README file with instructions for installation / usage in Markdown or other format.
● Submit your work as a ZIP archive.

Please, show off your skills in delivering high quality applications. Details matter!
